ReDrive

ZOLLERN

ReDrive Process

Delivery

The ZOLLERN ReDrive process begins when the customer delivers complete components or partial components back to our service centre. Here our service team records all parts and carries out an initial inspection if needed.

Disassembly and analysis

The components are then disassembled, and all individual parts are thoroughly analysed and recorded in detail. We document which parts can be overhauled, replaced or reused. We have developed our own systematic inspection plan to ensure that the quality and scope of the work remain constant.

Refurbishment and replacement

All worn or defective components are replaced with new parts. Reusable individual parts are reworked in an industrial refurbishing process that ensures a like-new quality.

Assembly and final inspection

The new and refurbished individual parts are assembled, and the components are finally painted. We subject all steps in the assembly process to the same testing procedures as for new products. Our numerous test benches and testing tools allow us to perform the final inspections quickly and reliably.

Return delivery

Once the components have gone through the rapid, structured ReDrive process in our service centre, we send them back to the customer in the high, customary ZOLLERN quality, ready for use in a new life cycle.

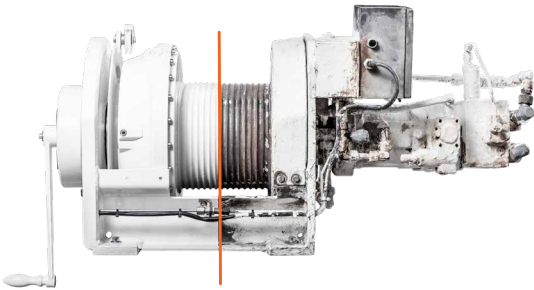

ZOLLERN ReDrive

Quality that lasts!

ZOLLERN ReDrive stands for durability and sustainability.

We make sure that your hard-working components can be returned to service as quickly as possible, in top condition, ready for use in a new life cycle. «

ZOLLERN ReDrive – Service Portfolio

- Repairs
- Overhaul and reconditioning
- Retrofitting and modification
